Abstract of the Disclosure

An imaging system (10) and method compensate for 360 different amplitudes of pixel signals generated by photoactive devices in an optical sensor (32) whose responses to projected light are not uniform. is divided into regions (52) such that the response of the photoactive devices within a region are substantially **3**65 equal. A processing circuit (34) compensates for different responses among different regions with a programmable gain amplifier (72) whose gain is dynamically adjusted when pixel signals generated in different regions are received.
